WhatsApp Bot Setup Guide

Step-by-Step Setup (Termux or PC)

1. Install Node.js (if not already installed)

Termux:

pkg update && pkg upgrade

pkg install nodejs -y

Windows/Linux:

Download Node.js from: https://nodejs.org

Install & check with:

node -v

npm -v

2. Create a new folder and go inside it

mkdir whatsapp-bot

cd whatsapp-bot

3. Initialize npm and install Baileys

npm init -y

npm install @whiskeysockets/baileys

4. Paste the script into a file

nano index.js

(Paste complete code and save it)

5. Run the script

node index.js

(Scan QR code from WhatsApp, only first time)

6. Message sending will start automatically

(An automated message will be sent every 10 seconds)

Generated Files:

auth_info.json - Created after QR scan (used for login)

index.js - Your main script

package.json - Created by npm init

node_modules/ - Installed dependencies

Important Notes:

- Do not send too many messages too quickly to avoid WhatsApp ban.
- Internet connection is required.
- Scan QR code from the same phone number you want to use.
- Once auth_info.json is created, QR scan is not needed again.
